Absorbing and Dispersing energy

The function and working of the pulsating energy sections throughout the Earth-facing side of a low-flying UFO

During enlargement of the detailed action, here slowed down, coloured neutrally, and simplified to explain its process, it was seen that the round segment of each of the many rills activated for adjusting energy exchanges - which I had assumed was smooth and protruding outwards during a dynamic change, while the whole rill pulsated and twirled throughout its length in order to push outer energy forward along it - was actually inwardly deepened and porous, with a rough surface containing many small circular areas, which could also absorb external energy.

It was open to the air, rather than, as I'd imagined, closed as insulation against it. Perhaps it soaked up energy and then from a deeper unseen layer of the rill neutralized it, and thereby effectively lessened it, instead of just using it for braking the UFO's propulsion.

After-thoughts:

This insight-dream helped to explain key details from my first close-up sighting of a whole UFO, second close-up of 2 pairs 2 days later, and last major sighting, which showed me new elements in a flight-pair's energy relations. I've been half-consciously wondering about such half-hidden connections since they originally occurred:

In sighting #2, the anti-gravity sections along the UFO's underside during its fast, diagonal "crash-descending" were thickly red.

In #4, the more calmly but dynamically rolling and revolving sections on the underside of each of the 4 somewhat diagonally, very low-flying UFOs, were yellowish white.

Each pair's mildly undulating next layer of fuzzy white energy was shaped somewhat like 2 partially fried eggs beside each other, with the adjacent part of each of their surfaces turned inwards, because they shared energy there as they flew perfectly parallel together with their partner. 2 separated pairs flew along loosely together like this during their independently curving course into the horizon's foggy clouds.

In #16, each of the much higher flying pair of UFOs had an internally circulating, bright white energy field, which was connected to its partner by a thin bridge of the same energy, ensuring their continuing parallel flight, also while slightly swerving together.
