the alligator-like scientist
and comparative surprises

Studying a human's emotional responses, in this case an adult woman's "surprise", by watching and analyzing a short full-screen film, which was uninteresting because her whole body and facial language showed the basic normal psychology of surprise, which even a child easily understands.

I then got an impulse to change my view of the whole scene, to look outside its witnessed frame and to the left, at another unknown framework, to see who was also watching this. There I saw a several layered, deeply folded, wrinkled, long, very dark green alligator-like head and face with larger nostrils and eyes than ours, an external section down the side of its head for hearing, a compressed mouth, and jowls.

This was a male scientist from another planet intensely studying, as if through a full-screen microscope, this film of an earthling taken from a UFO.

I was overtaken by my deep surprise, so I registered his head's features all at once, as a unified whole. The specific lines in his portrait are therefore approximations. It was impossible for me to judge his age, as I don't know their normal bodily development.
